COVID-19 Vaccine Timing for Special Populations

Special Consideration	Guidance	Source
Tested positive for COVID-19 in the past 10 days	• Defer until the patient has recovered from the acute illness (if the person had symptoms) and criteria have been met to discontinue isolation. • This applies to patients who develop SARS-CoV-2 infection before receiving any vaccine doses as well as those who develop SARS-CoV-2 infection after the first dose but before receipt of the second dose.	CDC Isolation Duration Guidance
Co-Administration of non-COVID-19 vaccines	• COVID-19 vaccines and other vaccines **may now be administered without regard to timing**. This includes simultaneous administration of COVID-19 vaccines and other vaccines on the same day, as well as co-administration within 14 days.	Interim Clinical Considerations for Use of COVID-19 Vaccines Currently Authorized in the United States
Received monoclonal antibodies for COVID-19 in the past 90 days	• If a patient gets monoclonal antibody therapy, vaccine should be delayed at least 90 days post therapy. • If a patient gets the first dose of vaccine, then gets monoclonal antibody therapy, the second dose should be delayed 90 days.	Interim Clinical Considerations for Use of COVID-19 Vaccines Currently Authorized in the United States
Immunosuppressants	• Currently, there is no evidence to support delaying or holding immunosuppressant before starting COVID-19 vaccine. Clinicians should consider vaccination on an individual basis, depending on the severity of the medical condition and the urgency of its treatment.	Interim Clinical Considerations for Use of COVID-19 Vaccines Currently Authorized in the United States NEJM- COVID19 Vaccine FAQs
Surgery (non-transplant)	• Currently, there is no evidence to suggest that there is a need to delay vaccination around surgery.	
Breast Imaging	• If possible, and when it does not unduly delay care, consider scheduling screening exams prior to the first dose of a COVID-19 vaccination or 4-6 weeks following the second dose of a COVID-19 vaccination.	SBI Recommendations for the Management of Axillary Adenopathy in Patients with Recent COVID-19 Vaccination

Special Consideration	Guidance	Source
Tuberculin Skin Test	• COVID-19 vaccines should not be delayed because of testing for TB infection. • Testing for TB infection with one of the immune-based methods can be done before or during the same encounter as COVID-19 vaccination. • When testing with TST or IGRA cannot be done at the same time as COVID-19 vaccination, these tests should be delayed ≥4 weeks after the completion of COVID-19 vaccination but generally should not be cancelled.	Interim Clinical Considerations for Use of COVID-19 Vaccines Currently Authorized in the United States
People vaccinated with COVID-19 vaccines not authorized in the United States	• *COVID-19 vaccines not authorized by FDA but authorized for emergency use by WHO* ○ People who completed a COVID-19 vaccination series with a vaccine that has been authorized for emergency use by the World Health Organization (WHO) **do not need** any additional doses with an FDA-authorized COVID-19 vaccine. ○ People who are partially vaccinated with a COVID-19 vaccine series authorized for emergency use by WHO may be offered an FDA-authorized COVID-19 vaccine series. • *COVID-19 vaccines not authorized by FDA or not authorized for emergency use by WHO* ○ People who completed or partially completed a COVID-19 vaccine series with a vaccine that is not authorized by FDA or not authorized for emergency use by WHO may be offered an FDA-authorized COVID-19 vaccine series.	List of vaccines currently authorized by WHO UM Guidance/FAQs
Solid Organ Transplant (SOT)	• *Vaccination prior to transplant:* ≥2 weeks prior to transplant. • *Vaccination post – transplant:* beginning 1 to 6 months after transplant. • If patient received thymoglobulin or rituximab, vaccinate at >3 months after receiving the drug. • If patient received alemtuzumab, vaccinate at >6 months after receiving the drug. • If patient undergoes transplant between the first and second dose, provide second dose at 1-month post-transplant.	American Society of Transplantation: COVID-19 Vaccine FAQ Sheet

Special Consideration	Guidance	Source
Stem Cell Transplant (HSCT)	• *Autologous:* wait at least 3 months before COVID-19 vaccine. • *Allogeneic:* wait at least 3 months before COVID-19 vaccine. • CAR-T recipients: wait at least 3 months before COVID-19 vaccine. • Defer if significant immunosuppressive therapy for GVHD (e.g., >20mg prednisone). • Defer for 3-6 months after cell depleting therapies (e.g., rituximab, thymoglobulin, alemtuzumab). • In general, give both doses before HSCT if possible, but do not delay HSCT to receive vaccine.
